Coding Exercise 2

In the top-left pane, implement a `WordNetLemmatizer` on the text from `document` which is captured from keyboard input.

When creating your model, make sure to:

- Use `nltk`
- Use `WordNetLemmatizer`
- Filter out stop words
- Ignore case
- Remove punctuation

Output the list of lemmatized words.

Test your code using the terminal in the bottom-left:

TRY IT

Example Input/Output:

```
Netflix, Inc. is an American subscription streaming service

['Netflix', 'American', 'subscription', 'streaming', 'serv
```

Submit your code by clicking the Check It button.

A Solution:

```
# tokenization
word_tokens = nltk.word_tokenize(document)

# filtering out stopwords and punctuation
filtered_word_tokens = [w for w in word_tokens if w not in stop_words]

#initializing lemmatizer and lemmatizing tokens
lemmatizer = WordNetLemmatizer()
lemmatized_word_tokens = [lemmatizer.lemmatize(token) for token in filtered_word_tokens]
print(lemmatized_word_tokens)
```

Check It!

LAST RUN on 12/27/2023, 5:30:57 AM

Check 1 passed

Check 2 passed
