

Formative Assessment 1

Complete the Parsons Puzzle.

The expected output:

```
Number of Tokens in the Gutenberg Corpus: 2621613
```

Drag from here

```
from nltk.tokenize import word_tokenize
```

```
print("Number of Tokens in the Gutenberg Corpus: ",  
      len(word_tokenize(gutenberg)))
```

Construct your solution here

```
from nltk.corpus import gutenberg
```

```
print("Number of Tokens in the Gutenberg Corpus: ",  
      len(gutenberg.words()))
```

The correct response is:

```
from nltk.corpus import gutenberg  
print("Number of Tokens in the Gutenberg Corpus: ", len(gutenberg.words()))
```

The following line of code imports the process which allows us to tokenize by word. This line is not necessary.

```
from nltk.tokenize import word_tokenize
```

The `len` function counts the number of elements in an object, and this is used correctly in the following line of code. However, the `.words()` reader function should be used to break corpora up by word because of how corpora are formatted. The `word_tokenize` method will not work on corpora directly. If we were to create a variable containing the text from the Gutenberg Corpus, then we would be able to run the `word_tokenize` method on that variable.

```
print("Number of Tokens in the Gutenberg Corpus: ", len(word_tokenize(gutenberg)))
```

Check It!
