Coding Exercise 2

Coding Exercise 2

Problem

The virtual environment `ex2` already exists. Activate `ex2` with the following command:

source ex2/bin/activate

Remove the `scipy` package and its dependencies.

Expected Output

Use the following command to list all of the installed packages in the `ex2` virtual environment:

ls ex2/lib/python3.6/site-packages

If you have properly removed `scipy` and its dependencies, you should see the following output:

easy_install.py pip-9.0.1.dist-info pkg_resources-0.0.0.dist-info setuptools
pip pkg_resources __pycache__ setuptools

Submit your code for evaluation.

Here is one possible solution:

python3 -m pip uninstall scipy numpy -y

The `scipy` package has `numpy` as a dependency. Both of these packages need to be removed. The `pip` command is `uninstall`. You can remove each package individually, but Python lets you list more than one package to be removed at once. The `-y` flag means that you do not have to manually enter `y` when confirming you want to remove a package.

Check It!

LAST RUN on 7/25/2023, 1:37:15 AM

Check 1 passed
