Coding Exercise 3

Coding Exercise 3

Problem

Create the text file `requirements.txt` that contains a list of all of the packages installed in the `ex3` virtual environment.

The `ex3` environment already exists. Activate it with the following command:

```
source ex3/bin/activate
```

Expected Output

The `cat` command takes the contents of a file and prints them to the terminal. Use the command below to list the contents of the `requirements.txt` file.

```
cat requirements.txt
```

Your output should look like this:

```
asgiref==3.4.1
Django==3.2.13
pkg-resources==0.0.0
pytz==2022.1
sqlparse==0.4.2
typing-extensions==4.1.1
```

Submit your code for evaluation.

Here is the solution:

```
python3 -m pip freeze > requirements.txt
```

The `freeze` command will generate a list of the current packages. However, this command will only print the list to the terminal. In order to create the `requirements.txt` file, use the `>` operator to redirect the output from `freeze` to `requirements.txt`.

Check It!

LAST RUN on 7/25/2023, 1:37:48 AM

Check 1 passed
