

Formative Assessment 2

Formative Assessment

Assume the following code:

```
from z import y

print(y.x())
```

Fill in the blanks below.

- `z` represents a package name.
- `y` represents a module name.
- `x` represents a function name.

Here are the correct answers:

- `z` represents a package name.
- `x` represents a module name.
- `y` represents a function name.

Think back to the `multiply` package we discussed on the third page. Using the `multiply` package, the `double` module, and the `double` function, it would look something like this:

```
from multiply import double

print(double.double(3))
```

Check It!
