

Formative Assessment 2

Formative Assessment

Fill in the blanks with either True or False.

- ☐ False - All packages must have a `requirements.txt`.
- ☐ False - The requirements file must be called `requirements.txt`.
- ☐ False - You can only install packages with the requirements file.
- ☐ True - You should have two different requirements files — one for development and another for production.

The correct answers are:

- False** - All packages must have a `requirements.txt`.
- False** - The requirements file must be called `requirements.txt`.
- False** - You can only install packages with the requirements file.
- True** - You should have two different requirements files — one for development and another for production.

The requirements file is only needed if you are using third-party packages. Convention dictates that `requirements.txt` be used as the file name, but Python won't throw an error if you use a different name. You can install and uninstall packages with the requirements file. Because development environments need different tools, there should be separate requirements files.
