

Formative Assessment 2

Assume the following code snippets:

Code Snippet 1

```
conda install requests
```

Code Snippet 2

```
conda install requests -y
```

What is the difference between the two code snippets?

- ☐ The two code snippets do the exact same thing.
- ☒ Code Snippet 2 will install the package without confirmation.
- ☐ Code Snippet 2 causes an error.
- ☐ Code Snippet 1 will install the package without confirmation.

The correct answer is:

| *Code Snippet 2 will install the package without confirmation.*

The `-y` flag will automatically assume `yes` for the installation confirmation. If you do not use the flag, you will have to manually confirm before the installation begins.
