Formative Assessment

What does the following line of code do?

```
conda create --name visualizations matplotlib
```

- ☒ Creates the virtual environment `visualizations` and installs the `matplotlib` package.
- ☐ Creates the virtual environment `matplotlib` and installs the `visualizations` package.
- ☐ Creates the virtual environment `visualizations`.
- ☐ Clones the virtual environment `visualizations` and installs the `matplotlib` package.

The correct answer is:

Creates the virtual environment `visualizations` and installs the `matplotlib` package.

Because the command uses `conda create`, it is creating a new virtual environment. The value after the `--name` flag tells us the name of the environment — `visualizations`. What comes after the environment name are the packages to be installed as well.
