

<code>termcolor</code>	1.1.0	ANSII Color formatting for output in terminal.
<code>typing-extensions</code>	4.1.1	Backported and Experimental Type Hints for Python 3.6+
<code>wcwidth</code>	0.2.6	Measures the displayed width of unicode strings in a terminal

Add a Dependency

```
cd learning-poetry
```

terms of the end result, there is no difference in using `pip` or Poetry when installing a package. Both of these package managers use PyPI when downloading

After the installation process finishes, use the `show` command to list out all of the dependencies for the `learning-poetry` package.

try returns a nice list of dependencies with columns. You get the name of dependency, its version, and a short description of the dependency.

The `show` command shows the dependencies and their dependencies. What is not in `is what` are the dependencies of the newly installed `fire` package. We can combine `show` with the flag `--tree` to show a hierarchical structure of dependencies.

```

fire 0.4.0 A library for automatically generating command line interfaces.
├── six *

```

- Install the `python-dateutil` package.

view the dependencies in the tree form.

```
poetry add git+ssh://git@github.com:codio-content/shapes-package.git
```

Updating

poetry update

If you want to update a specific package, use its name with `update`.

can update more than one package at a time if you list them out after `update`,
a space to separate each package.

ability of the `update` command to update a package is limited by information found in the `pyproject.toml` file. The snippet below is an example from the `toml` file. This section lists all of the dependencies for a project. `fire` version 0.4.0 is required. However, notice the `^` in front of the version number. This symbol means that Poetry will make any update to `fire` as long as it is less than 1.

signify if version 1 of `fire` was released after installing an earlier version of the package. Updating your project would not upgrade `fire` to the latest version.

Instead, install the package again but append `@latest` after the package name. Yarn will install the latest version and update the `toml` file to reflect this change.

Reading Question

Select the command that tells Poetry to upgrade all dependencies in a project.

Select the command that tells Poetry to upgrade all dependencies in a project.

poetry update

The correct answer is:

poetry update

The `update` command will update all dependencies. You do not need a modifier like `*` or `all` to tell Poetry to update everything. You use `@latest` when adding a particular package; it is not used with `update`.
