Coding Exercise 2

Coding Exercise 2

Problem

The open Dockerfile is empty. Complete the Dockerfile so that it:

- Imports the `python:3.9` base image
- Copies all of the files to the `/project` directory
- Changes the working directory to `/project`
- Sets the entry point run the `my_script.py` file

Expected Output

When you feel that your Dockerfile is complete click the `VERIFY` button below to verify your work. The program will either return an error that needs to be addressed or it will tell you that the file passed all the tests.

VERIFY

All tests passed

Submit your code for evaluation.

The correct answer is:

```
FROM python:3.9
COPY . /project
WORKDIR /project
ENTRYPOINT ["python", "my_script.py"]
```

- Use `FROM` to select the base image, which should be `python:3.9`.
- Use the `COPY` command to copy files. The `.` represents all of the files, and the `/project` is the destination for the copied files.
- `WORKDIR` sets the working directory, which should be `/project`.
- Finally set the entry point with `ENTRYPOINT`. We want to run our script so the commands should be `"python"` and `"my_script.py"`.

Check It!

LAST RUN on 7/26/2023, 2:25:17 AM

All tests passed
