Coding Exercise 3

Activate the virtual environment `exercise3` for this coding exercise.

conda activate exercise3

Problem

The Pyinstaller package has already been installed. Create just a spec file for Pyinstaller such that:

- The name of the executable will be `my_app`
- Pyinstaller will look in the `code/coding_exercise_3` directory for required code

Important, you do not need to generate the executable file. You just need to generate the spec file.

Expected Output

Running the terminal command with the above specifications should create a file called `my_app.spec`. Use the `cat` utility to print the contents of this file to the terminal.

cat my_app.spec

You should see the output below. Verify that the `name` category is set to `my_app` and the `path` is set to `code/coding_exercise_3`. The path should be found under the `a` section.

a = Analysis(
 ['exercise3.py'],
 pathex=['code/coding_exercise3'],

The name of the application can be found towards the bottom of the file in the `coll` section.

coll = COLLECT(
 exe,
 a.binaries,
 a.zipfiles,
 a.datas,
 strip=False,
 upx=True,
 upx_exclude=[],
 name='my_app',
)

Submit your code for evaluation.

The correct command is:

pyi-makespec exercise3.py --name my_app --paths=code/coding_exercise3

- The command to make a Pyinstaller spec file is `pyi-makespec`
- Then list the name of the Python script - `exercise3.py`
- Use the `--name` flag to set the name to `my_app`
- Finally use the `--paths` flag to set the path to `code/coding_exercise3`

Check It!

LAST RUN on 7/26/2023, 2:59:45 AM

Check 1 passed

Check 2 passed
