Coding Exercise 5

Activate the virtual environment `exercise5` for this coding exercise.

conda activate exercise5

Problem

You are currently in the `ex5` directory, which contains the script `exercise5.py`. The Pyinstaller package is already installed in the virtual environment. Create a program that does the following things:

- Asks the user to input text
- Returns the length of the input
- Repeat this process until the user types “q”
- When the user enters “q” stop the script and print `Goodbye!`

Then convert this script into an executable with Pyinstaller using the **one-file** approach.

Expected Output

The bundling process should create the executable `exercise5` which is inside the `dist` directory. List the contents of `dist` with the following command. You should see only the executable file and nothing else.

ls dist

Next run your executable file with the command below.

./dist/exercise5

Check your work by entering `1234567`, and the script should return `7`. Check it again with `pyinstaller`, and the output should be `11`. Finally enter `q`. The script should stop and print `Goodbye!`.

Submit your code for evaluation.

Here is one possible solution for the Python code:

while True:
 txt = input('Enter some text: ')
 if txt == 'q':
 print('Goodbye!')
 break
 else:
 print(len(txt))

- Use a while loop that repeats infinitely
- Get text from the user with the `input` function
- If the input is `q` print `Goodbye!` and break out of the loop
- If the input is something else, print the length of the input

The Pyinstaller command is:

pyinstaller exercise5.py --onefile

- Use the `--onefile` flag to crate an executable with only a single file as the end result.

Check It!

LAST RUN on 7/26/2023, 2:56:21 AM

Check 1 passed
Check 2 passed
Check 3 passed
Check 4 passed

Mark as Completed
