

Learning Objectives: Distributing with Docker and Heroku

Learners will be able to...

- Define a container
- Describe the benefits of using a container
- Explain the importance of the Dockerfile
- Identify several important characteristics of Flask app
- Identify the benefits of using a platform as a service

Make Sure You Know

Students are comfortable working in the terminal, using Conda to manage packages and virtual environments, as well as have some experience with HTML and CSS.

Limitations

You will create a simple Flask app as this is not a web development course. Docker is discussed only in a cursory manner. The example will be kept to a minimum. Heroku will handle the build and deploy processes of the Flask app.
