Hive Union Group By Error

In the following query, I am trying to count up the distinct, and total occurrences of the column "primary" and and summarise this for each column.

I have two source tables, which contain similar information. I want to union these to pull all the information together before counting this up.

However, using the logic below I get the following error. Can someone please advise where this is going wrong?

```
select COUNT(distinct primary), COUNT(primary), mycolumn
from (select primary, mycolumn from mytablea where mycolumn >= a and mycolumn <= b
      union all
      select primary, mycolumn from mytableb where mycolumn >= a and mycolumn <= b)
group by mycolumn
```

FAILED: ParseException missing EOF at 'by' near 'group'

Thanks..

You have to give an alias to the subquery. Something like this should work:

```
select COUNT(distinct primary), COUNT(primary), mycolumn
from (select primary, mycolumn from mytablea where mycolumn >= a and mycolumn <= b
      union all
      select primary, mycolumn from mytableb where mycolumn >= a and mycolumn <= b) q1
group by mycolumn
```

Not a very informative error message. – [Eric Walker](#) Aug 5 at 18:05
