Interactive Llamafire Sandbox

 Launch lab

Instructions

Lab Goal

Develop a Python function to add two numbers and showcase understanding of the llama.cpp chatbot interface.

Lab Description

Llama is a friendly chatbot. It helps with coding tasks. User needs assistance writing a Python add function. Chatbot provides starter code and guides user through the process.

Navigate to `/home/coder/coursera` in the terminal

Run the model as shown by typing ./ in front

Open a web browser and type in the url: `http://127.0.0.1:8080` and complete a prompt

Explore your results. Make sure to be patient as this model runs on the CPU and is slightly slower than GPU hosted models.

Lab Steps

1. Explore the llama.cpp chatbot interface, noting the various settings and options available.
2. Enter the prompt: "Write a Python add function that accepts x and y, and returns the sum."
3. Analyze the provided starter code and understand its functionality.
4. Modify the code as needed to create the desired add function.
5. Test the function by providing sample inputs and verifying the outputs.

Reflection Questions

1. What is the purpose of the starter code provided by the chatbot?
2. How does the chatbot interface allow for customization of the conversation?
3. What are the benefits of using a chatbot for coding assistance?
4. How does the add function differ from the starter code example?
5. What are some potential use cases for the add function you developed?

Challenge Questions

1. Modify the add function to handle non-numeric inputs gracefully.
2. Enhance the function to accept an arbitrary number of arguments.
3. Implement error handling for scenarios like division by zero or invalid operations.
4. Explore other features of the llama.cpp chatbot interface.
5. Build a simple calculator program using the add function as a starting point.
