Your latest: 100% • Your highest: 100% • To pass you need at least 80%. We keep your highest score.

Module 1 Quiz

Next item →

1. When Meta released Llama 2, which models were included in that release? 1 / 1 point

- ☒ A base model and a chat model, in sizes of 7B, 13B, and 70B
- ☐ A base model and a code generation model, in sizes of 7B, 13B, and 70B
- ☐ A chat model and a image model, in sizes of 7B, 13B, and 70B
- ☐ A base model and a image model, in sizes of 7B, 13B, and 70B

✔ Correct

Correct.

Your grade

To pass you need at least 80%. We keep your highest score.

2. Which Llama 2 model(s) did Meta fine tune with human feedback? 1 / 1 point

- ☐ All models, including the base and chat models, in selected sizes
- ☒ The chat model (all sizes)
- ☐ The base model (all sizes)
- ☐ The chat model (only the 13B and 70B sizes)

✔ Correct

3. True or false: When fine tuning a large language model Meta used only reinforcement with human feedback. 1 / 1 point

- ☒ False, the Llama code model was fine tuned in part through a novel use of the generation of python test cases created by the llama base model.
- ☐ True, Meta only used reinforcement learning from human feedback for fine-tuning to ensure the model's outputs align closely with human expectations.

✔ Correct

4. True or false: The Llama 2 model is open source, and follows an OSI license. 1 / 1 point

- ☐ True, Llama 2 is fully open source and adheres strictly to OSI standards in all aspects.
- ☒ False, while Meta claims the model is open source, it does not follow an OSI approved license

✔ Correct

5. True or false: Quantization is a lossless compression method for reducing LLM size 1 / 1 point

- ☒ False, quantization does reduce LLM size, but is a lossy as it reduces the precision of the models
- ☐ True, quantization effectively reduces the size of LLMs without any loss in model performance or precision.

✔ Correct
