Whether the outputs I got are incorrect?

Hi Chris,

It took me almost a week to look into llama 2 documentation, and would like to ask you a few questions regarding assignment.

1. Does the model we choose between 13b and 13b-Chat have an effect on autograder decision?
2. If the both model do not play any role for the autograder, what's wrong with the code that giving me expected outputs?
3. If using of regular expression not recommended for the outputs, there is grammar expression of Llama 2. May I ask you for more resources about to delve into it so that I could use this grammar instead of re package.

Below are the code snippets and outputs:

```
111
112 # Output: [
113     # MailingAddress(name='John Smith', business_name=' ABC Corporation', street_number='123', street_text='Main St'
114     # MailingAddress(name='Jane Doe', business_name=' XYZ Enterprises', street_number='456', street_text='Elm St', c
115     # MailingAddress(name='Bob Johnson', business_name=' DEF Inc.', street_number='789', street_text='Oak St', city=
116     # MailingAddress(name='Sarah Lee', business_name=' GHI Partners', street_number='112', street_text='Maple Ave',
117     # MailingAddress(name='Mark Davis', business_name=' JKL LLC', street_number='345', street_text='Broadway St', ci
118
```

Thanks in advance for your time and advise.

Kind regards,
