0 point with correct result length and type for Question 1 and 2

HT Herman Dávid Tamás Learner

3 months ago

```

grammar = """
root ::= givenname " " familyname "\n"
givenname ::= [A-Z] [a-z]*
familyname ::= givenname [-] givenname?
"""

def generate_names() -> list[str]:
    results: list[str] = []

    result = model.create_completion(prompt,
                                     grammar=llamaGrammar.from_string(grammar),
                                     stream=True,
                                     temperature=1.0,
                                     max_tokens=4096,
                                     top_p=10)
    count = 0
    name = ""
    for item in result:
        name += item["choices"][0]["text"]
        if name[-1] == "\n":
            count += 1
            if count == 10:
                break
        results = name.split("\n")[:-1]
        print(results)
    return results

from_string grammar:
root ::= root_4
root_1 ::= givenname [ ] familyname [0+000A+]
givenname ::= [A-Z] givenname_5
familyname ::= givenname familyname_7
root_4 ::= root_1 root_4 |
givenname_5 ::= [a-z] givenname_5 |
familyname_6 ::= givenname [-] givenname
familyname_7 ::= familyname_6

```

In [3]:

Grade cell `q1_tests` Score: 0.0 / 1.0 (Top)

```

# Invoke student code
results=generate_names()

# Verify the length
assert len(results)==10, f"You did not return ten and only ten results, instead we got {len(results)}."

```

```

from_string grammar:
root ::= root_4
root_1 ::= givenname [ ] familyname [0+000A+]
givenname ::= [A-Z] givenname_5
familyname ::= givenname familyname_7
root_4 ::= root_1 root_4 |
givenname_5 ::= [a-z] givenname_5 |
familyname_6 ::= givenname [-] givenname
familyname_7 ::= familyname_6

```

My problem is that there's no hint what's wrong because I returned a list with 10 names in the correct format and it's still 0 point.

I even took out the `|` operator because I heard it causes issues with the autograder.

I suspect I'm either getting bitten by the same bug, or missing something incredibly obvious. My code isn't pretty but it does result in ten names for the first question, five trip ideas for the second, and five addresses for the third.

Yes, so a patch should be coming on Monday. The issue is that llama.cpp, and thus the llama-cpp-python bindings, actually print a grammar out to standard error. This then shows up in the notebook as you've seen in the videos. However the grading software we are using, called nbgrader, sees any output on standard error as a failed test, and thus determines that you haven't passed the question, when in reality it's just your grammar code being displayed.

The patch we will push to the grader will capture and suppress standard error, making it so that your tests will run and be
