Module 3 Quiz

1. What does few-shot prompting do?

Design Learning Objectives

1 / 1 point

☒ Giving several examples in the prompt which cause the Llama 2 inference engine to pick up patterns.

☐ Giving the Llama 2 inference engine a chance to create the correct output and then stopping using the stopping criteria.

Due

Attempts

☐ Running the Llama 2 inference engine over a few different prompts and choosing the best output.

☐ Fine tuning the Llama 2 model through llama.cpp.

☒ Correct

Correct. Few-shot prompting involves providing multiple examples to help the model understand the desired task or pattern.

Your grade

To pass you need at least 80%. We keep your highest score.

2. True or false: The llama.cpp library provides a callback function to allow programmers to determine when the model can be stopped.

1 / 1 point

☒ True, this is called the stopping criteria.

Like

Dislike

Report an issue

☐ False, the llama.cpp library requires manual intervention to stop the model.

☒ Correct

3. Fill in the blank. The logit closest to _____ has the highest probability of being selected for output.

1 / 1 point

☐ 1

☐ -infinity

☒ 0

☐ +infinity

☒ Correct

4. True or false: The debugger in VS Code is not useful, and using it is a sign of weakness as a programmer.

1 / 1 point

☐ True, tools like debuggers only slow down the development process.

☒ False. The debugger is awesome.

☒ Correct

Correct. Dr. Brooks highly recommends learning how to use it if you do not already know how.

5. True or false: A watch expression in VS Code causes the Llama 2 model to watch prompts closely?

1 / 1 point

☒ False. The watch expression allows you to write python expressions when debugging your application, supercharging your ability to understand your code and how it works.

☐ True, it sets up a monitoring system within the Llama 2 model to alert you about changes or issues with your prompts in real-time.

☒ Correct

Correct. Watch expressions in VS Code are powerful debugging tools

6. True or false: The Llama 2 model uses a grammar to plan its query completion, ensuring that it chooses tokens which adhere to the grammar rules.

1 / 1 point

☐ True, the Llama 2 model incorporates an advanced grammar-checking algorithm that ensures each token selected adheres strictly to grammatical rules.

☒ False: The Llama 2 model is unaware of the grammar, and does not plan at all. Instead, the llama.cpp software package uses the grammar to reduce the probability (logit value) of tokens which do not adhere to the grammar.

☒ Correct

Correct. It highlights a common misconception about AI models like Llama 2. They generate text based on patterns learned from data rather than explicit grammatical rules.
