1 / 1 point

**1.** A developer is building a travel application and needs to provide users with up-to-date information on local attractions and events. Which AI Studio feature is most suitable for integrating real-time, current information into the application? Select the best answer.

- Multimodal Analysis
- Google Search grounding
- Maps Integration
- Text Generation

**Nice work**

Correct! Google Search grounding allows the model to access and use information from Google Search, providing the most current data available.

1 / 1 point

**2.** A project manager wants to quickly test several different AI-powered feature ideas for a new product before committing development resources. What is the primary way AI Studio accelerates the initial stages of the development lifecycle? Select the best answer.

- It enables the creation and testing of functional prototypes with a visual interface.
- It generates complete application code based on a high-level project description.
- It streamlines the integration of AI models into existing deployment pipelines.
- It provides detailed performance benchmarks for various foundation models.

**Nice work**

Correct! AI Studio allows users to experiment with prompts and features through a user interface, making it possible to validate ideas quickly before development.

1 / 1 point

**3.** A developer is setting up a new project in Google AI Studio and needs to create an API key for their application to communicate with the Gemini model. What is a critical security practice to follow when managing API keys for a project? Select the best answer.

- Creating an API key for all of the project's services and environments
- Storing the API key in a project management tool for easy access
- Committing the API key to a private code repository for version control
- Applying specific restrictions to the key to limit its scope of use

**Nice work**

Correct! Limiting a key's permissions, such as by IP address or API service, is a critical security measure that follows the principle of least privilege.

1 / 1 point

**4.** A developer is creating a prototype in AI Studio for an e-commerce chatbot. The goal is for the chatbot to identify a product from an image a user uploads and then describe it. Which combination of features would be required to build this prototype in AI Studio? Select the best answer.

- Visual captioning and Google Search grounding
- Data grounding and text generation
- Image analysis and text generation
- Image analysis and function calling

**Nice work**

Correct! Image analysis is needed to understand the content of the user's uploaded image, and text generation is needed to create the product description.

1 / 1 point

**5.** A developer is preparing to launch a new feature and has been testing it extensively using an API key from AI Studio. What is the recommended approach for managing API keys when moving an application from a private testing environment to a live production environment? Select the best answer.

- Migrate the testing API key to the production project to consolidate billing and usage data.
- Clone the testing API key to ensure configuration consistency between environments.
- Use the existing API key in both environments to streamline the deployment process.
- Create a new API key specifically configured for the production environment's needs.

**Nice work**

Correct! A dedicated API key for production ensures that environments are isolated, allows for precise permission settings, and enables independent monitoring and control.
