Your grade: 100%

Your latest: **100%** • Your highest: **100%** • To pass you need at least 80%. We keep your highest score.

Next item

1. How does a visual interface like Google AI Studio help a developer in the early stages of a new project? Select the best answer. 1 / 1 point

- It generates the marketing materials and proposes app store descriptions for the finished project.
- It replaces the need for an API key by providing a secure local offline environment for all model testing.
- It limits the AI model to a single personality type, enabling the developer to not be distracted by too many options.
- It allows rapid testing of ideas and prompts to prove a concept works before committing to complex coding.

Nice work

Correct! AI Studio acts as a workbench where you can experiment with prompts and see results instantly, bridging the gap between an initial idea and the first line of code.

2. Let's say that you're part of a coding team. Why is it a vital security practice to have separate API keys for development and production? Select the best answer. 1 / 1 point

- It doubles the processing speed of the Gemini 3 model by splitting the data load between two keys.
- It allows developers to bypass the per-minute request quota on the live application.
- It prevents the Google Cloud console from monitoring the billing and usage costs of the project while it is being worked on or developed.
- It ensures that any issues or exposure of a test key do not interrupt the service for live end users.

Nice work

Correct! By separating the keys, a developer can experiment or troubleshoot in a test environment safely. If the development key is compromised, it can be disabled without affecting the production key used by real users.

3. An organization wants to make a massive archive of unlabeled historical photographs searchable. How can the Google AI Studio platform's multimodal capabilities be applied to this task? Select the best answer. 1 / 1 point

- By using the model to identify objects and text within the images to generate automatic descriptive tags
- By reducing the resolution of the photos to improve the transcription accuracy of the background noise
- By converting the photos into natural-sounding audio descriptions
- By using the prompt window to manually type out a description for each photo in the database

Nice work

Correct! Multimodal tools allow the model to analyze images and provide descriptions or tags (like "1960s" or "crowd"), which can be used to organize and search the archive efficiently.

4. You are training new developers in Google AI Studio. How can they use the Build section to start developing a custom application, like a photo editor or a conversational voice app? Select the best answer. 1 / 1 point

- By selecting a video generation model to record a demo of the project idea
- By manually coding the backend in the API key creation window
- By entering a natural language description of the idea into the prompt window
- By downloading a list of pricing tiers to see if the idea is feasible and affordable

Nice work

Correct! In the Build section, users can describe their application idea in a prompt window, and the system will begin creating the app based on that description.

5. In the Run Settings window of the AI Studio development environment, how does adjusting the thinking level parameter affect the model's performance? Select the best answer. 1 / 1 point

- Thinking level allows the user to manually increase the model's maximum word count for every response.
- Thinking level permanently upgrades the Flash model to have the same reasoning capabilities as the Pro model.
- Thinking level acts as a switch that either enables or disables the model's ability to use Python code.
- Thinking level functions as a tunable resource that balances the depth of reasoning against the speed of the response.

Nice work

Correct! Setting a higher thinking level allows for richer reasoning but takes more time, while a lower level produces results much faster by using fewer computational resources.

6. A developer on your team asks, "In the prompt evaluation workflow, what is the purpose of the Form a Hypothesis step?" What do you tell them? Select the best answer. 1 / 1 point

- The step identifies specific weaknesses in the baseline and proposes a change to improve them.
- The step is where the platform automatically generates Python code to deploy the model to a live server.
- The step records the final results and saves the prompt into a shared library.
- The step is where you select between Gemini Pro and Gemini Flash based on the total project budget.

Nice work

Correct! After creating a baseline, you must hypothesize how a specific change, like adding a persona or a constraint, might improve the output before you run an A/B test.

7. When developing an application that needs Google AI Studio to generate a complete Python script based on multiple complex logic parameters, why is it a good idea to select a model like Gemini 3.1 Pro over a faster model like Flash version? Select the best answer. 1 / 1 point

- Gemini 3.1 Pro is better suited for handling complex requests that require deep reasoning and multi-step thinking.
- Gemini 3.1 Pro is the only model capable of outputting code in a format that can be read by an Integrated Development Environment (IDE).
- Gemini 3.1 Pro automatically executes the code in a secure sandbox to verify there are no syntax errors before displaying it.
- Gemini 3.1 Pro bypasses the need for the user to provide specific parameters like input file types or API libraries.

Nice work

Correct! For intricate tasks like building a batch summarizer from scratch with specific data-handling rules, the Pro version's advanced reasoning capabilities provide more reliable results than faster, lighter models.

8. When creating a second version of a script that includes rate limiting, which of the following features should be added to help the application stay within standard requests per minute (RPM) quotas? Select the best answer. 1 / 1 point

- An automatic error handling block that only triggers for 404 "Page Not Found" errors
- A feature that limits the number of summary bullets the AI is allowed to generate per day
- A user login screen that restricts the number of people who can access the script
- A default two-second sleep delay between the processing of individual items

Nice work

Correct! Adding a timed delay between items is an API-friendly strategy that prevents the script from making requests too quickly and exceeding the allowed rate limits of the service.

9. How does a developer typically add a new safeguard, such as input validation to check for empty prompts, in a natural language-enabled AI workspace? Select the best answer. 1 / 1 point

- By searching through a library of pre-written Python if-blocks to copy and paste in
- By adjusting the thinking level slider until the model realizes it needs to validate the input
- By exporting the code to an external IDE and waiting for the debugger to suggest the change
- By describing the desired feature in plain language using a built-in chat interface

Nice work

Correct! Instead of manual coding, you can simply ask the tool to "add input validation" in the chat. The system then interprets the request and inserts the necessary logic automatically.

10. In a complete development workflow, what is the strategic purpose of building an interactive room makeover prototype before writing production code? Select the best answer. 1 / 1 point

- To make sure that the application's database is fully populated with real user photos before the app is built
- To get a sense of the application's look and functionality and prove the concept's value before investing time in production-grade engineering
- To bypass the need for any testing or quality assurance (QA) once the final code is written
- To create a finalized, unchangeable version of the app that can be sold to investors

Nice work

Correct! This step allows for vibe testing and experimentation, reducing the risk of spending weeks on a project only to find that the core features or styles don't work as imagined.
