1. A group of developers are brainstorming possibilities for creating and building applications using Google's Gemini models. Which development environment is best suited for experimenting and learning? Select the best answer. 1 / 1 point

- (•) Google AI Studio
- ( ) Python
- ( ) Gemini API
- ( ) Visual Studio

Nice work

Correct! Google AI Studio is a code-free tool for rapid prototyping and experimentation, while Gemini API is used to integrate Gemini models directly into production applications.

2. A developer you're working with asks you, "I've heard you are supposed to keep your API key secret to avoid hacking. What's the best way to do that?" Select the best answer. 1 / 1 point

- ( ) Hide it in a function.
- ( ) Break it down into several parts and mix it in with your code.
- (•) Keep it in an .ENV file.
- ( ) Generate a new API key every time.

Nice work

Correct! You say, "Store your API key in an environment variable, or .ENV file. That way you can load it into your app by calling the .ENV file and not calling the key directly, keeping it secret."

3. How are rate limits measured when working with Gemini API? Select all that apply. 0.8 / 1 point

- [x] Tokens per minute (TPM)

Nice work

Correct! Rate limits are measured across three dimensions: Requests per minute (RPM), Tokens per minute (input) (TPM), and Requests per day (RPD).

- [x] Requests per day (RPD)

Nice work

Correct! Rate limits are measured across three dimensions: Requests per minute (RPM), Tokens per minute (input) (TPM), and Requests per day (RPD).

- [ ] Tokens per day (TPD)

This should not be selected

Not quite. Please refer to *Gemini API fundamentals*.

- [x] Requests per minute (RPMs)

Nice work

Correct! Rate limits are measured across three dimensions: Requests per minute (RPM), Tokens per minute (input) (TPM), and Requests per day (RPD).

4. Which Gemini model should be used for tasks that need deep understanding and high-quality responses? Select the best answer. 1 / 1 point

- ( ) Gemini API Creator
- ( ) Gemini Extra Duty
- ( ) Gemini Flash
- (•) Gemini Pro

Nice work

Correct! Gemini Pro is designed for tasks that need deep understanding and high-quality responses.

5. When a developer sets the thinking level to "high" in a model's configuration parameters, what is the operational trade-off they should expect? Select the best answer. 1 / 1 point

- (•) The model will spend more effort on multi-step planning, which will likely increase the time it takes to respond.
- ( ) The model will generate shorter, more concise answers.
- ( ) The API will automatically switch the model from Gemini 3 Pro to Gemini Flash to maintain efficiency.
- ( ) The model will prioritize interaction speed over the quality of the response.

Nice work

Correct! Increasing the thinking level improves the model's ability to solve complex problems, but this additional computation results in higher latency.

6. A logistics firm is building a workflow where AI has to autonomously check weather data, verify vehicle availability, and generate a multi-stop delivery route. Why would they need to choose a model with strong thinking capabilities for this project? Select the best answer. 1 / 1 point

- (•) Because thinking allows the model to create a plan of all the steps that are needed before executing each task.
- ( ) Because thinking allows the model to execute all the different steps simultaneously.
- ( ) Because the thinking trace summary provides a legally binding record of the AI's decisions.
- ( ) Because thinking models are the only tools capable of processing raw data.

Nice work

Correct! In complex workflows involving multiple calls or actions, a thinking model plans the sequence upfront. This improves reliability and ensures the model handles dependencies between tasks correctly.

7. You are working on performance tuning. How is the thinking level configuration used within a model request? Select the best answer. 1 / 1 point

- ( ) It replaces the need for setting max tokens or context length in the configuration object.
- ( ) It's a feature that automatically translates the final response into multiple languages to save computing power.
- (•) It's used as a setting to control how much internal reasoning the model performs based on the complexity of the task.
- ( ) It's used as a binary toggle that can only be turned on or off.

Nice work

Correct! You can set a minimal level for simple tasks to optimize for speed, or a high level for complex analytical tasks to help the model evaluate options and return structured answers.

8. Why is it necessary for developers to connect large language models (LLMs) to built-in tools like Google Search rather than relying solely on the model's pre-trained knowledge? Select the best answer. 1 / 1 point

- ( ) To bypass the need for a user to provide a written prompt by having the model choose what the user wants to see.
- (•) To allow the model to access information published after its training data was finalized, such as today's news or current stock prices.
- ( ) To ensure the model can translate text into multiple languages without requiring a specialized translation API.
- ( ) To increase the model's word count limits when writing longer creative stories or articles.

Nice work

Correct! LLMs have "static" training data, meaning their knowledge is frozen at a specific point in time. Tools act as the model's "eyes and ears," allowing it to retrieve real-time information from the live web.

9. In which of the following scenarios would a developer specifically choose the URL context tool over a general search tool? Select the best answer. 1 / 1 point

- ( ) When the developer needs to bypass a website's login screen or paywall to access restricted financial data.
- ( ) When the application needs to fact-check a viral claim by looking at hundreds of different news sources simultaneously.
- (•) When the AI needs to answer questions based strictly on a known document, such as a company's latest internal security policy page.
- ( ) When the goal is to provide a list of the best restaurants in a city based on general public opinion and ratings.

Nice work

Correct! The URL context tool is ideal when you have a specific, trusted source. It fetches the content from that exact page so the model can provide answers based on specific information.

10. In previous workflows, developers often had to make one call to get information and a second call to format it. How does Gemini 3 improve this process when using tools and structured outputs? Select the best answer. 1 / 1 point

- ( ) It automatically converts all HTML content into PDF format before the model processes the request.
- ( ) It requires the developer to use a dictionary style for the prompt instead of natural language.
- ( ) It eliminates the need for an API key by using Google Search grounding as a default authentication method.
- (•) It allows the model to use tools and produce structured JSON output within a single request.

Nice work

Correct! Gemini 3 supports using tools like Google Search and Structured Outputs simultaneously. This means you can retrieve live data and have it formatted into your specific JSON schema in one go, saving time and resources.
