Cropping

Review Learning Objectives

1. Cropping is the process of creating a new image that is formed as a subregion of another image. We define a "cropping box" that contains our region-of-interest, and we are "cropping" away the parts of the image that are not needed, keeping only the region-of-interest in the resulting image.

1 / 1 point

Load the built in Matlab image 'logo.tif' using `load('logo.tif')`

Submit your assignment

Try again

Crop it to create a new image formed by the subregion of pixels in rows 30 to 50 and columns 20 to 90 in the 'logo.tif' image matrix.

Display the cropped image using the `imagesc` function
