Final note

Great work reaching the end of the course and, if you took courses 1 and 2, the entire specialization. You now have the skills to tackle a wide variety of problems from many different domains. Not only will you be more efficient in your work, but you can also help your colleagues by writing programs and creating apps for shared use. Congratulations!

Students often ask for additional courses to continue learning and applying their new skills. One specialization we recommend is [Practical Data Science with MATLAB](#)  created by MathWorks. The specialization covers many tools and approaches not covered in our specialization. You'll learn to quickly import and explore data, clean and prepare your data, and perform machine learning using interactive tools that generate the required code. These can be useful approaches when you first start trying to solve a new problem, and often it is more efficient to start with such interactive tools rather than directly using code when performing exploratory data analysis. Once you have a better understanding of the data, you can apply the techniques you learned in this specialization to customize and create programs tailored to your specific needs.

Good luck in your future work and thank you for participating in *MATLAB Programming for Engineers and Scientists*!
