

Module 3 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Define classification and provide examples.
- Define an ordinal encoding and construct one from categorical data.
- Define three metrics for classification problems: accuracy, precision, and recall.
- Explain why ordinal encoding may not be ideal.
- Define an indicator matrix and encode data using one.
- Explain the process of linear regression with this encoding.
- Explain how decision boundaries are defined.
- State the problem of classification from the perspective of Statistical Decision Theory.
- Define LDA and the estimates it performs on the statistical framing of the classification problem.
- State the LDA rule.
- Describe how logistic regression relates to LDA.
- Explain how logistic regression maximizes likelihood.
