

Module 4 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Define a spline.
- State the advantage of splines over high-degree polynomials.
- Define a knot.
- State the model of a cubic spline.
- Describe the motivation of smoothing splines
- Define a natural cubic spline.
- Define the roughness penalty.
- State the regularization problem in full generality.
- State the general form of the penalty function, according to Girosi et. al.
- Define kernel functions.
- Define a reproducing kernel Hilbert space (RKHS) and explain its properties.
