Maximum Likelihood Inference Quiz- Part 1

Instructions

Review Learning Objectives

1. What does the method of maximum likelihood estimation (MLE) seek to achieve in statistical modeling?

1 / 1 point

☐ To uniformly distribute the probability of a model.

☒ To find the parameter values that maximize the likelihood of the observed data given the model.

☐ To calculate the probability of the data given the model.

☐ To minimize the difference between predicted values and actual values.

Correct

Assignment details

Correct: MLE aims to find the parameter values that make the observed data most probable.

2. In the context of maximum likelihood estimation, what is the "likelihood"?

1 / 1 point

☐ The overall probability of the data given the model.

☐ The probability of the model given the data.

☐ The frequency of the model outcome in the data.

☒ The probability of the observed data given a set of parameters under a specified model.

Correct

Assignment details

Correct: Likelihood is the probability of the observed data under a model for specific parameters.
