

Module 7 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Define maximum likelihood inference, maximum likelihood estimator, and related terms.
- Describe the process of maximum likelihood inference.
- Compute two examples of maximum likelihood inference, one of which is OLS linear regression.
- Understand the basics of Bayes' Theorem.
- Explore how Bayesian Inference differs from frequentist approaches.
- Learn the process of constructing models using Bayesian methods.
- Discuss the advantages and challenges of Bayesian modeling.
