

Module 8 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Define a decision tree and its components.
- Describe the construction process of a decision tree.
- Understand the decision tree diagram.
- Define a random forest.
- Describe its construction.
- List its hyperparameters.
- Describe what a support vector machine is attempting to do.
- Explain how class overlap is handled.
- State the mathematical setup of the SVM problem.
- Discuss the aim of k-means clustering.
- Discuss the strengths and limitations of k-means clustering.
- Define the k-means clustering algorithm.
- Describe the biological inspiration of artificial neurons.
- Define key terms such as weights, bias, activation function, and hidden layer.
- List some hyperparameters of neural network models.
- List two activation functions commonly used in these networks.
- List two ways the model variance is mitigated.
- List two ways parameter convergence is improved.
