Support Vector Machines Quiz

Next item →

Instructions

Review Learning Objectives

1.

What is the primary objective of a Support Vector Classifier?

1 / 1 point

To minimize the number of support vectors used in the classification.

To predict continuous values.

To classify data points by minimizing the distance from the data points to the hyperplane.

To find a hyperplane that separates two classes in the feature space with maximum margin.

Submitted

Attempts

Correct: SVC aims to find the best separating hyperplane with the maximum margin between classes.

Try again

2.

In SVM, what are support vectors?

100%

View submission

1 / 1 point

The vectors used to support the margin, maximizing computational efficiency of the SVM algorithm.

Data points that are closest to the decision boundary and influence the position and orientation of the hyperplane.

Data points that are farthest from the decision boundary.

Any data points that are misclassified by the SVM.

Correct

Correct: Support vectors are the critical elements of the training set that define the hyperplane.
