Module 2 Introduction

Lesson 1: Linear Regression and Least Squares

Lesson 2: Modification of Linear Regression: Subset Selection

Lesson 3: Coefficient Shrinkage for Linear Regression: Ridge Regression and LASSO

Lesson 4: Data Transformations and Linear Regression

Reading: Data Transformations and Linear Regression Reading 5 min

Video: Data Transformation Examples and Linear Regressions 7 min

Practice Assignment: Data Transformations and Linear Regression Quiz Submitted

Data Transformations and Linear Regression Quiz

Instructions

Review Learning Objectives

1. What is the purpose of applying a logarithmic transformation to the dependent variable in linear regression? **1 / 1 point**

- To allow linear regression to be used for classification problems.
- To stabilize the variance and make the relationship between the variables more linear.
- To increase the range of the dependent variable.
- To ensure that the regression coefficients are all positive.

Correct

2. Which type of transformation can be used on an independent variable to reduce the influence of extreme values in linear regression? **1 / 1 point**

- Square root transformation
- Multiplicative transformation
- Exponential transformation
- Square transformation

Correct

Like Dislike Report an issue

3. In the context of linear regression, what is a potential drawback of applying non-linear transformations to the predictor variables? **1 / 1 point**

- They can make the interpretation of the model coefficients straightforward.
- They can often complicate the interpretation of the model coefficients.
- They eliminate any multicollinearity present in the model.
- They always reduce the coefficient of determination of the regression model.

Correct
