1. What is the primary output of a logistic regression model? **1 / 1 point**

- The exact value of the dependent variable.
- The difference between observed and predicted values.
- The probability of a particular outcome occurring.
- The ratio of the independent variables.

Correct
Correct! Logistic regression outputs the probability of a specific outcome.

Try again

2. Which of the following best describes the function used in logistic regression? **1 / 1 point**

View submission **See feedback**

- The hyperbolic tangent function, which maps values between -1 and 1.
- The exponential function, which maps values to a rapidly increasing curve.
- The linear function, which maps input values directly to a continuous range.
- The logistic (sigmoid) function, which maps any real-valued number into the range of 0 to 1.

Like Dislike Report an issue

Correct
Correct! Logistic regression uses the logistic function for this purpose.
