1. What is bootstrapping in the context of statistical analysis? **1 / 1 point**

- (●) A resampling technique used to estimate statistics on a population by sampling a dataset with replacement.
- () A method of dividing a dataset into training and test sets.
- () A technique for correcting bias in a model.
- () A process for identifying outliers in a dataset.

Correct
Correct! Bootstrapping involves repeatedly sampling from a dataset with replacement to estimate population statistics.

2. Why is bootstrapping particularly useful in statistics? **1 / 1 point**

- () It ensures that the statistical models built are completely free of bias.
- (●) It allows estimation of the sampling distribution of almost any statistic using only the data available.
- () It significantly reduces the computational complexity of statistical calculations.
- () It eliminates the need for assuming the underlying distribution of the data.

Correct
Correct! Bootstrapping provides a way to estimate the distribution of a statistic based on the available data.
