1. How would I copy the directory “test” from my home directory to my projects directory? Assume your username is “mooc”.

1 / 1 point

See *Linux - Part 2* to review

- ☐ Option a: cd /projects/mooc; cp -R ~/test .
- ☐ Option b: mv /home/mooc/test /projects/mooc/
- ☐ Option c: cp -R /home/mooc/test/ /projects/mooc
- ☒ Both a and c

👍 Nice work

a and c are just two different ways to accomplish the same goal.

2. Which statement is true about deleting files or directories in a Linux environment?

1 / 1 point

- ☒ Once an item is deleted, it will be gone forever, without a chance of recovery
- ☐ While difficult, it is usually possible for most people with some knowledge of Linux to recover a deleted file or directory
- ☐ Files are more easily recoverable than directories
- ☐ The best command for deleting files or directories is the Linux “delete” command

👍 Nice work

This is an extremely important take away from this class - there is no recovery option when you remove a file or directory in Linux.

3. A colleague has asked you to use the Linux "df" command to display the file system disk space usage in human readable format. What *other* Linux command discussed in class would you use to discover how to properly use df?

1 / 1 point

man df

👍 Nice work

This command displays the manual for the Linux df command.

4. If I am running a program on a supercomputer, and I am writing data out to disk, which location is appropriate for the data? The data is 2 GB.

1 / 1 point

See *Filesystems* to review

- ☐ The home directory
- ☐ The mid-level directory space (ie, projects or work)
- ☒ Scratch
- ☐ Offsite

👍 Nice work

This directory is an appropriate place for input/output of job scripts as it is much faster than home or projects/workspace directories.

5. Why would a person want to use a bash script rather than enter the commands in at the command line?

1 / 1 point

- ☐ It's too much typing!
- ☐ Scripts allow you to remember and reuse commands easily
- ☐ You can easily share scripts between users
- ☒ All of the above

👍 Nice work

a) While tongue-in-cheek, it can get time consuming to continually type commands over and over, especially if you are always reusing the same, or similar, commands. b) You may have done research on a particular Linux command's options to get it to perform the exact operation you need, and having that command and its flags in a script allows you to remember the command more easily. c) It's common to share scripts among colleagues, research group members, or the world (via Github, etc.)

6. Which of the following statements are true about environment variables?

1 / 1 point

- ☐ Environment variables can be used system-wide or user-wide among all shells
- ☐ A user cannot define an environment variable
- ☐ A user can find a list of environment variables by typing “env var” on the command line
- ☒ An example of how to set an environment variable is to first define a variable within a shell, and then export the variable.

👍 Nice work

This is correct.

7. What is the best syntax for using scp to transfer a file from the scratch directory on a remote server called login.remote.edu to your Desktop on your laptop? To answer this question assume the following: your username on the remote system is 'mooc' and on your laptop is 'lastname', the file to be moved is test.py, and the path to your Desktop on your laptop is /home/lastname/Desktop?

1 / 1 point

- ☐ scp /scratch/mooc/test.py mooc@login.remote.edu
- ☒ scp mooc@login.remote.edu:/scratch/mooc/test.py /home/lastname/Desktop
- ☐ scp lastname@login.remote.edu:/home/lastname/Desktop/test.py .
- ☐ scp /scratch/mooc/test.py /home/lastname/Desktop mooc@login.remote.edu

👍 Nice work

One way to accomplish this is to be on the laptop and pull the file down from the remote machine
