

Installation

These installation instructions explain how to install the Jupyter Notebook and the IPython kernel.

! Important

Jupyter installation requires Python 3.3 or greater or Python 2.7.

If you need to use Python 2.6 or 3.2, you may install [IPython 1.2](#). Older releases of IPython are available [here](#).

! See also

For detailed installation instructions for individual Jupyter or IPython subprojects, please see the documentation or GitHub repos of the individual subprojects listed in [Jupyter Subprojects](#) document.

How to install Jupyter Notebook

While the Jupyter Notebook allows users to run code in many different programming languages, the Jupyter Notebook itself is implemented in Python. To install Jupyter Notebook, you will also need Python installed on your system.

Installation Scenarios

- [New Users: New to Python and Jupyter](#)
- [Experienced Python user: New to Jupyter](#)
- [Upgrading Jupyter](#)

! Note

All commands shown below must be run in the Terminal (Mac/Linux) or Command Prompt (Windows)

New Users: New to Python and Jupyter

If you're new to Python, we highly recommend installing [Anaconda](#). Anaconda includes and conveniently installs Python, the Jupyter Notebook, and other commonly used packages for scientific computing and data science. Follow Anaconda's instructions for downloading the Python 3.4 version. You may need to click on the "I want Python 3.4" link to download Anaconda for Python 3.4.

After you have Anaconda installed, you should make sure that Jupyter is up to date. Run the following command in the Terminal (Mac/Linux) or Command Prompt (Windows):

```
conda install jupyter
```

Alternatively, you may also use the Anaconda Launcher application to update to the latest version.

Now, you may consider [installing additional kernels](#) and [next steps](#) such as running the Jupyter Notebook.

Experienced Python user: New to Jupyter

As an existing Python user, you may have installed Python from the Python website, a system package manager, or using Anaconda. The command for installing Jupyter Notebook is slightly different depending on how you installed Python. Depending on whether or not you use Anaconda, follow one of these two instructions to install Jupyter on your system.

Anaconda and conda users

If you have Anaconda installed, run the following command in the Terminal (Mac/Linux) or CommandPrompt (Windows) to install Jupyter:

```
conda install jupyter
```

Now, you may consider [installing kernels](#) and [next steps](#).

pip users

If you already have Python installed and are **not** using *conda* or Anaconda, you may install the Jupyter Notebook using Python's package manager *pip*:

```
pip3 install jupyter
```

(Use `pip` instead of `pip3` for legacy Python 2)

! Note

Some of Jupyter's dependencies may require compilation, in which case you would need the ability to compile Python C-extensions. This means a C compiler and the Python headers. On Debian-based systems (e.g. Ubuntu), you can get this with:

```
apt-get install build-essential python3-dev
```

And on Fedora-based systems (e.g. Red Hat, CentOS):

```
yum groupinstall 'Development Tools'  
yum install python3-devel
```

(Use `python` instead of `python3` for legacy Python 2)

Now, you may consider [installing kernels](#) and [next steps](#).

Upgrading to Jupyter: Experienced Users

The Jupyter Notebook used to be called the IPython Notebook. If you are running an older version of the IPython Notebook (version 3 or earlier) you can use the following to upgrade to the latest version of the Jupyter Notebook.

If using 'pip':

```
pip install -U jupyter
```

OR

If using Anaconda or `conda`:

```
conda update jupyter
```

! See also

The [Migrating from IPython](#) document has additional information about migrating from IPython 3 to Jupyter.

Installing kernels

Installing the Jupyter Notebook as described above will also install the [IPython kernel](#) which allows working on notebooks using the Python programming language.

To run notebooks in languages other than Python, you will need to install additional kernels. For more information, see the full [list of available kernels](#).

Next steps

Congratulations. You have installed Jupyter Notebook and are ready to [run the notebook](#).
