10X Productivity with Extraction & Custom Instructions

Do you want to go beyond cutting and pasting?

You need to start using [custom instructions](#)  to make the content that GPT-4V creates more useful.

Add this custom instruction:

Whenever I ask you to create an email, also add a mailto link under it with: [Send Email] (mailto: [email-address] ? [subject]=[subject-text] & [body]=[body-text])

Now, ask it to draft an email for you and watch a magic link appear at the end.

How does this work? This instruction tells GPT-4V that it should create links that you can click that will automatically populate your email client. You have to tell it to, not just draft the email, but to automatically create a mailto: link so that you can click it and have the email imported into the mail client. This saves the cutting / pasting, which is particularly important on a mobile phone. Since you will probably do a ton of GPT-4V on a mobile phone, you want to minimize the friction of cutting/pasting. Custom instructions work without GPT-4V, but they become real productivity boosts when you starting working with vision on a mobile device.

But, you can get a lot more creative with it. What about if you do a lot of ordering and need to send it to an administrative assistant for reimbursement?

Try this:

Whenever I ask you to draft an email for reimbursement, you should create a mailto link with an email to my admin (FILL IN) with the contents of the order and detailed costs. Include a business purpose (fill in with something reasonable or what I give you) and tell them to charge it to "Account: 123.34.234.234.234". It should be in the format: [Submit for Reimbursement] (mailto: [email-address] ? [subject]=[subject-text] & [body]=[body-text])

If you want the most out of your ChatGPT or other LLM experience, tell it to create links for you for email, sms, specific apps, etc.
