1. What is a sign that your model has overfit the training set? 1 / 1 point

- Bad performance on the training set but good performance on unseen data
- Good performance on the training set as well as new data
- Good performance on the training set but much worse performance on unseen data
- Decrease in performance on the training set after good initial trainings set performance

Nice work

2. Early stopping is primarily used to: 1 / 1 point

- Increase model complexity over the course of the training
- Improve training data quality
- Prevent overfitting
- Reduce the number of epochs needed to learn the training set

Nice work

3. What does “patience” refer to in the context of early stopping? 1 / 1 point

- The number of training steps taken before reducing the learning rate
- The number of steps training is continued after a predefined criterion has been met
- The number of training steps the learning rate is kept constant
- The number of training steps

Nice work

4. True or False: Regularization helps to avoid overfitting. 1 / 1 point

- False
- True

Nice work

5. Which of the following is *not* an optimizer implemented in PyTorch as of 2024? 1 / 1 point

- AdamW
- MAdam
- Adadelta
- SGD

Nice work
