1. What is multitask learning in the context of neural networks? 1 / 1 point

- Using multiple datasets for a single task
- Running multiple training sessions in parallel
- Training multiple separate models simultaneously
- Training a single model to perform multiple tasks

Nice work

2. Why could natural language inference and paraphrase identification be learned in a multitask fashion? 1 / 1 point

- They use datasets of equal sizes
- They have the same output format
- Their data consist of sequences of similar length
- They require similar semantic understanding

Nice work

3. What does often determine the number of output layers of a multitask model? 1 / 1 point

- Dataset size
- Model size
- Input dimension
- Number of distinct tasks

Nice work

4. What does unsampling refer to in the context of multitask training? 1 / 1 point

- Repeating training examples from one task more frequently than those of another
- Efficient sampling of auxiliary task examples to increase model entropy
- Scaling of a models' output probability distribution to increase the probability of target-task labels
- Using only the most frequent words of a tasks training set

Nice work

5. True or False: How to weigh losses belonging to different tasks in multitask training is usually determined by looking at the model outputs for the first 5-10 training examples 1 / 1 point

- True
- False

Nice work
