1. What is provided to the model during in-context learning? 1 / 1 point

- A one-sentence prompt describing the problem
- Error messages
- Examples of desired input–output pairs
- Technical specifications

Nice work

2. True or False: Many researchers and practitioners cannot easily use standard finetuning to adapt large language models to their settings because of the resources this would require. 1 / 1 point

- True
- False

Nice work

3. Which of the following is true about adapters? 1 / 1 point

- Adapters cannot be stored independently of the model they are used in combination with
- Adapters are often larger but much faster than the original model
- Adapters consist of a small number of parameters that are added to a model and updated during finetuning
- Adapters are pretrained layers that you can use to initialize a new model you want to train

Nice work

4. Which of the following statements about prompting is incorrect? 1 / 1 point

- Prompting is easy to learn as it mostly involves instructions in natural language
- No coding is needed for prompting
- Prompting is the same as zero-shot learning
- It's impossible to make sure your prompt is the best possible prompt

Nice work

5. In the context of large language models, which of the following are important challenges? 1 / 1 point

- Using a large language model, even via prompting, can be computationally or financially expensive
- When using a model you do not host locally, there can be problems with privacy
- Customers might trust large language models more than they should because they seem human-like
- All of the above

Nice work
