

Linear model without an intercept

You are working as a data scientist in a company. You would like to develop a model to predict the salary that your company is willing to pay for the employees. This information will be used by the human resource sector of your company to recruit new employees based on the applicants' experience.

You have a dataset in CSV format (see reading materials), which is stored in the 'salary_dataset.csv'. The file contains two columns, YearsExperience and Salary, which represent the experience and the salary of each employment, respectively. Obviously, the salary is closely related to the years of experience.

Build a linear model (model_1) without an intercept, which you can use to predict the salary.

Then, use it to predict the salary for a person with 5 years of experience.

Script

 Save

 Reset

 MATLAB Documentation (https://www.mathworks.com/help/)

Open Item in MATLAB Online

```
1 % Load data
2 data = readtable('salary_dataset.csv');
3 x = data(:, 'YearsExperience');
4 y = data(:, 'Salary');
5
6 % Try to use left array division (\) to achieve this
7 model_1 = x \ y; % complete this line
8 salary_1 = model_1 * 5; % complete this line
9
```

 Run Script 

Tests: All Tests Passed

Submit 

-  Is the linear model correct?
-  Is the predicted salary correct?

Output

Code ran without output.
