

Discussion Guidelines

We are so glad that you're participating in Interpretable Machine Learning! We hope these discussion boards also can serve as a tool for you to support and be supported by your peers.

We suggest that you introduce yourself and participate in the discussion boards as an opportunity to reflect on what you are learning throughout the course. Participating in the discussion boards will also allow you to practice with peers and consider how you would apply these skills in your professional life. Participation in discussion boards is optional.

Building an inclusive community is important to us, so please consider these guidelines when you post or respond to others:

1. We ask that you work to create a welcoming space for your peers, and please use inclusive language in your discussion posts. For some guidance on inclusive language, you can use the [APA guide](#) as a starting point.
2. Respect the opinions and experiences of others, even if they differ from yours.
3. Reminder, people from all over the world may take this course - please safeguard your personal information by not providing identifying information that could be mis-used.
4. Critique ideas, not individuals.
5. Help others. You may have more experience with the topic or more practice using online discussion platforms than others. Friendly feedback to your peers, when appropriate, is usually appreciated. This is a shared learning environment where we all benefit from each other's success.

If you see something against the rules, something that makes you feel unsafe, or have concerns about a member of the learning community [let Coursera know](#). We want this to be a welcoming course!
