COACH

1. Which of the following is NOT a step in the process of preparing data for training a word embedding model? 1 / 1 point

Tokenization

Model testing

Preprocessing

Text representation

2. Which of the following is correct about one-hot encoding when you represent text with basic vectorization? 1 / 1 point

One-hot encoding encodes the word to a vector whose dimension corresponds to its position in the vocabulary and zeros to the rest.

One-hot encoding encodes the word to the frequency it occurs in a sentence.

One-hot encoding converts a sentence to a dense vector that retains the meaning of the sentence.

One-hot encoding divides a sentence to character-level.

Correct

This option is correct

3. What are the benefits of using word embedding (such as word2vec) compared to basic vectorization (such as one-hot encoding) when you convert text to vectors? 1 / 1 point

Compared to basic vectorization, which converts text to sparse vectors, word embedding converts text to dense vectors.

Compared to basic vectorization, which converts text to vectors without semantic meaning, word embeddings represent words in a vector space where the distance between them indicates semantic similarity and difference.

You can use pre-trained word-embedding to represent text.

All of the above.

Correct

This option is correct

4. What is the difference between continuous bag-of-words (CBOW) and skip-gram, the two primary techniques of word2vec? 1 / 1 point

CBOW uses a center word to predict surrounding words, whereas skip-gram uses surrounding words to predict a center word.

CBOW uses surrounding words to predict a center word, whereas skip-gram uses a center word to predict surrounding words.

CBOW uses previous words to predict the next word, whereas skip-gram uses the next word to predict previous words.

CBOW uses the next word to predict previous words, whereas skip-gram uses previous words to predict the next word.

Correct

This option is correct
