5.5 Dealing with Outliers: RANSAC Self-check Quiz

1 / 1 point

1. Consider the problem of finding 2 images consisting of 10 pairs of matching points. The RANSAC algorithm would work well provided:

☐ At least 11 points are outliers

☐ There are at least 4 pairs of matching points

☒ Less than 10 points are outliers

Correct

Please refer to the lecture video.

2. Which of the following statements about RANSAC are true?

☒ It is sensitive to the amount of outliers in case of lots of outliers.

☐ For a given sample size, the points sampled are the same.

☐ It is only used to compute homography between images.

☒ There is no upper bound on the time taken to compute the homography using RANSAC.

Correct

Like Dislike Report as issue

RANSAC is a simple and general algorithm and is applicable to many different problems. However, it's worth considering its random nature, sensitivity to outliers and the high amount of time taken (number of iterations) to find a reasonable solution.
