

 > Module 1

If you're new to CUDA and are lost please read this

MK Manav Karthikeyan Learner

2 years ago

I was very new to CUDA when I started this course and to be honest was dumbfounded by this assignment. The assignment is pretty simple though, first please make yourself comfortable the basic keywords and syntax of cuda. There are multiple basic vector add programs out there. The next thing to is familiarize yourself with the `__device__`, `__global__` and `__host__` keywords and how and when they're used. When you're done with this you can practically write your own functions for this assignment, the reason I'm saying this is because the given functions in the lab assignment give a lot of errors and I still have no idea why. But I was able to complete the assignment by recreating all the functions on my own but DO NOT ALTER THE PERFORM TEST FUNCTION as this is how your output is verified. A good place to start learning CUDA is the NPTEL course on GPU architecture and programming. (Week 3 - Intro to CUDA).
