Additional DALL-E Usage

Codio: API_Keys

The material in this course assumed that you have done course 1 module 1, where you were instructed on how to create the environment variable to store your OpenAI API-key. If you have it already stored you can skip this page. If not follow these instructions. Please note: You must get your OpenAI key from OpenAI and store it as instructed or you might get errors when generating your code.

ENV variables support for projects

Why? -----

Environment variables are useful when you want to avoid hard-coding access credentials or other variables into code. Additionally, if there is a variable you will keep using across assignments, modules, or courses it can be a pretty useful tool to store that. This allows us to not to have to copy and paste our variable everywhere and maintain a variable at the user level.

API KEY? -----

Before we can get started using the OpenAI API, we need to have an account with OpenAI. Use this [link](#) to create an account if you already don't have one or to access your API key if you do have one. OpenAI will ask you a few questions along the way.

Once your account has been created, you need to find your API key. This allows you to connect to the OpenAI API and make use of their models. Click on your profile picture in the top-right corner. Then click on "View API keys".)

How?-----

In order to create to create our environmental variable we are going to click on the codio tab on the top left. Inside the preferences tab, click on the environmental variable button

You should get to a page where similar to a dictionary you can create key value pair. In the key area, name your env variable and the value tab you can have the value associated with it. You should get to a page where similar to a dictionary you can create key-value pair. In the key area, name your key "OPENAI_KEY" and paste your OpenAI key in the value section. Warning please make sure you use the name above, or else you might have some errors as the assignments assume there is a variable name "OPENAI_KEY".

From there we can press the save button on bottom left. Then we can restart our Codio box, to make sure the environmental is saved and stored. To restart, press the project tab next to the codio drop down then click on restart box. Please note: refresh, leaving the page then coming back or anything other than just restart box won't necessarily save your variable.

Mark as completed
