Simple Image Composition

moon_image_url = generate_base_image('moon')
night_sky_image_url = generate_base_image('night sky with stars')

Saving our new images

img_data = requests.get(moon_image_url).content
with open('moon_image.jpg', 'wb') as handler:
 handler.write(img_data)
img_data = requests.get(night_sky_image_url).content
with open('night_sky.jpg', 'wb') as handler:
 handler.write(img_data)

TRY IT!

Command was successfully executed.

Click here to refresh your moon image

Click here to refresh your night sky image

After generating your images comment out the code that calls on new images to be generated, so we can keep our base images consistent.

#saving our images as variables.
moon_image=Image.open('moon_image.jpg')
night_sky_image=Image.open('night_sky.jpg')

Resize the moon image to fit the composition
moon_image = moon_image.resize((200, 200), Image.ANTIALIAS)

Ensure the moon image has the correct mode with an alpha channel
moon_image = moon_image.convert('RGBA')

Overlay the moon image on top of the night sky image
night_sky_image.paste(moon_image, (150, 100), moon_image)

Save the composed image to a file
night_sky_image.save('night_sky_with_moon.jpg')

TRY IT!

Click here to refresh your moon and night sky image

In the given example, we generate two images using the DALL-E 2 API: a moon and a night sky. What do we do next to create a composite image?

- Use a gradient mask to create a smooth transition between the images.
- Overlay the moon image on top of the night sky image.
- Blend the moon and night sky images using a mask.
- Apply a filter to both images before combining them.

Overlay the moon image on top of the night sky image.
In this example, we resize the moon image and ensure it has an alpha channel. Then, we simply overlay the moon image on top of the night sky image using the paste() function from the PIL library. This creates a composite image with the moon placed over the night sky.
