Code Snippet

```
messages=[
    {"role": "system", "content": "You are a coding assistant with expertise in Python."},
    {"role": "user", "content": "Write a Python function to find the factorial of a given number using recursion."}
]

print(response['choices'][0]['message']['content'].strip())
```

TRY IT!

Here is a Python function to find the factorial of a given number using recursion:

```
```python
def factorial(n):
 if n == 0 or n == 1:
 return 1
 else:
 return n * factorial(n-1)
```
```

To use this function, simply call it with the desired number as an argument:

```
```python
result = factorial(5)
print(result) # Output: 120
```
```

This function checks if the number `n` is 0 or 1, in which case it returns 1 (as the factorial of 0 and 1 is 1). Otherwise, it calls the same function with `n-1` as an argument and multiplies the result with `n` to get the factorial of `n`. The recursion stops when `n` becomes 0 or 1.

RUN TEST HERE

Command was successfully executed.

True or False:

Including examples of input and output data in your query can help the AI generate more accurate and relevant code snippets.

☒ True

☐ False

Including examples of input and output data or providing a code skeleton for the AI to work with can indeed help the AI generate more accurate and relevant code snippets.

Check It!
