Coding Exercise

- Create the API Call:** Write a Python script that uses the ChatGPT API to request a Python function for reversing a string. Remember to follow the techniques for generating code snippets mentioned in the lesson. Make sure the user query explicitly mentions the programming language (Python), the desired functionality (reversing a string), and the system message sets the context of the AI as a coding assistant with expertise in Python. Additionally, write a print statement to help you visualize the generated code.

```
response = openai.ChatCompletion.create(  
    model="gpt-3.5-turbo",  
    messages=[  
        {"role": "system", "content": ""},# make sure to replace empty string  
        {"role": "user", "content":""}# make sure to replace empty string  
    ]  
)
```

- Test the Generated Code:** Once you receive the Python function from the API, copy and paste it into a separate Python file (test.py). Run this script to ensure the function works as expected. Try with different inputs to verify the correctness of the function.
- Evaluate and Refine:** Critically assess the quality of the generated Python function. Does it meet the specified requirements? Does it follow good coding practices? If there are any issues, refine the code as necessary or adjust your API call to provide more explicit instructions or constraints.

TRY IT!

Sure! Here's a Python function that reverses a given input string:

```
python  
def reverse_string(input_string):  
    return input_string[::-1]  
...
```

This function uses slicing (`[::-1]`) to reverse the input string and returns the reversed string as the output.

RUN TEST FILE

When ready to submit your test2.py file click the button below.

The following is a sample generated by the API:

```
def reverse_string(s):  
    return s[::-1]
```

Here is a sample API call:

```
response = openai.ChatCompletion.create(  
    model="gpt-3.5-turbo",  
    messages=[  
        {"role": "system", "content": "You are a coding assistant with expertise in Python"},  
        {"role": "user", "content": "Write a Python function to reverse a given string"}  
    ]  
)  
  
print(response['choices'][0]['message']['content'].strip())
```

Check It!

LAST RUN on 7/23/2023, 12:50:53 AM

Check 1 passed

Mark as Completed
