Setting up

OpenAI API key: To use the ChatGPT API, we'll need an API key from OpenAI. Which we have been using the entire course.

Python libraries: We'll be using several Python libraries, including the OpenAI Python library and the `dotenv` library for managing environment variables.

Once we have all the necessary tools and libraries installed, we can start building our web application. Here's how to set up our development environment:

Install Python libraries: We'll also need to install several Python libraries using pip. The following libraries wont be necessary while inside Codio but will mention them if want to end up working outside the platform. In addition to Flask and the OpenAI Python library, you will need to use the following library for managing environment variables if outside the Codio platform. Run the following commands to install these libraries:

```
pip install openai
pip install python-dotenv
```

With all these tools in place we can start building our application.

Which of the following Python libraries is **NOT** mentioned in the passage as a requirement for setting up the development environment?

☐ Flask

☐ OpenAI

☐ python-dotenv

☒ numpy

Numpy is not mentioned in the passage. The mentioned Python libraries are Flask, OpenAI, and python-dotenv.
