Creating our CSS

Now we are going to change our prompt to create the CSS.

In order to generate the CSS, we are going to change our prompt, had make it clear we just want the CSS.

```
prompt = " In this HTML file, we define a basic structure for our website that
```

TRY IT

Command was successfully executed.

Below is a sample answer generated by ChatGPT. Feel free to use either the one that your program generated or the one below. If the one ChatGPT Generated has errors, you can also use ChatGPT to debug.

```
body {
    font-family: Arial, sans-serif;
}

h1 {
    text-align: center;
}

form {
    max-width: 800px;
    margin: 0 auto;
}

.input-group {
    display: flex;
    flex-direction: column;
    margin-bottom: 10px;
}

label {
    font-weight: bold;
}

textarea {
    height: 100px;
}

#submit-button {
    margin-top: 20px;
}
```

The generated CSS code includes a rule to style all elements on the page with the font Arial, falling back on any sans-serif font if Arial is not available.

☒ True

☐ False

The font-family property set on the body element applies to all elements within the body, and will cascade down to all child elements unless overridden by a more specific rule. In this case, Arial, sans-serif is set as the font-family, which means it will try to use Arial first, but will use any sans-serif font if Arial isn't available.
